Why do we need Data Science in higher education:

Automation and artificial intelligence will accelerate the shift in workforce skills

<https://www.mckinsey.com/featured-insights/future-of-work/skill-shift-automation-and-the-future-of-the-workforce#>

Why do we need Data Science in higher education:

Skills mismatch vs automation and artificial intelligence (AI) adoption

DATA SCIENCE (ANALYTICS) VERSUS DATA ENGINEERING (PROBLEM SOLVING)

[0] Collection	Big Data (Acquisition/Aggregation) Empirical (Sensor/IoT Measuring/Sampling)	Gathering
[1] Access + Retrieval	Ownership (Open/Closed) Storage (Cloud/Database)	Ingesting
[2] Preparation + Wrangling (Munging)	Loading Feature Extraction/Reduction Normalization Transformation Conversion Graphical (spatial) Ontological (Language) Semantic (text) Rule-based/Algorithmic Quantitative/Qualitative Numerical/Categorical/Symbolic	Processing
[3] Exploration	Mining (Heuristics/Statistics/Descriptive/Prescriptive) Construct Useful Insights/Trends/Patterns/Diagnosis (Information)	Discovering
[4] Analysis + Machine-Learning	Parameter Selection + Representation Summarization Problem Solving Diagnostic Prediction Encryption Visualization Virtualization	Conceptualizing
[5] Abstraction	Performance (Measure/Monitor) Evaluation & Review Decision & Advise or Prescription (Interactive/Passive) Story Telling Prototyping	Modelling
[6] Organization + Managing		Presenting
[7] Automation + Reporting		Applying

DATA SCIENCE focuses on **Analytics**

Figure 3.11 Process of predictive analytics.⁷

DATA ENGINEERING focuses on **Problem Solving**

Data engineers build and maintain **data pipelines**

Data pipelines encompass the journey and processes that data undergoes within a company.

Data engineers are responsible for creating those pipelines.

Inspired by Daniel Keim, "Visual Analytics: Definition, Process, and Challenges"

To make sense of the world

“ Sense-making is the way that humans choose between multiple possible explanations of sensory input. ”

– Dave Snowden

Conference papers

Multi-ontology sense making:
a new simplicity in decision making

David J Snowden
Founder, Cynefin Centre for Organizational Complexity, UK

Imagine organising a birthday party for a group of young children. Would you agree a set of learning objectives with their parents in advance of the party? Would those objectives be aligned with the mission statement for education in the society to which you belong? Would you create a project plan for the party with clear milestones associated with empirical measures of achievement? Would you start the party with a motivational video so that the children did not waste time in play not aligned with the learning objectives? Would you use PowerPoint to demonstrate to the children that their pocket money is linked to achievement of the empirical measures at each milestone? Would you conduct an after-action review at the end of the party, update your best practice database and revise

standard operating procedures for party management?

No! Instead, like most parents, you would create barriers to prevent certain types of behaviour, you would use attractors (party games, a football, a videotape) to encourage the formation of beneficial largely self-organising identities; you would disrupt negative patterns early, to prevent the party becoming chaotic, necessitating the draconian imposition of authority. At the end of the party you would know whether it had been a success, but you could not have defined (in other than the most general terms) what that success would look like in advance.

From The Cynefin Manifesto, www.cynefin.net

Introduction

The purpose of this article is to introduce a new simplicity into acts of decision making and intervention design in organisations. That may seem ironic given the title, with its use of the terms ‘ontology’ and ‘sense making’ which may be unfamiliar to readers; but new ideas often need new or at least unfamiliar language and I make no apology for that (although some readers may wish to skip the remainder of this introduction which may only be relevant to academics wishing to situate my language). New language aside, the basic principles that underlie this paper are very easy to understand and are illustrated by the inset example of the children’s party. Multi-ontology sense making is about understanding when to use both methods of management outlined in the story, both the structured and ordered approach based on planned outcomes and the un-ordered, emergent approach focused on starting conditions expressed as barriers, attractors and identities.

Ontology^a is derived from the Greek word for being, and it is the branch of metaphysics that concerns itself with the nature of things. In this article I am using it to identify different types of system defined by the relationship, if any, between cause and effect. I will later discuss two contrasting types of ontology (order and un-order), each of which requires a different approach to both diagnosis and intervention. In practice, we need to consider three physical and five human ontologies. The three physical ontologies are order, complexity and chaos; in human systems order divides into visible and hidden forms and we add a fifth state of disorder. These are more fully described elsewhere.¹ Here I will combine complex and chaotic into a single category of un-order and ignore disorder.

^a Ontology is commonly misused in the IT profession as an elevated version of taxonomy and is in fact closer to onomastics than it is to ontology.

What do these people have in common?

HUMAN FACTORS

De mens als maatstaf der dingen

NEUROETHOLOGIE

Neuro-ethologisch perspectief: wat maakt ons humaan?

Gewaarwording & Perceptie

Cognitie & Semiotiek

Gedrag & Communicatie

Theory of Mind (ToM)

Biologie / neuro-wetenschappen

Biologie / Neuro-wetenschappen

Biologie / Psychologie

Psychologie / Sociologie

Data / Informatie / kennis verbindt mensen en vormt zo onze samenleving

Human-Factor benadering gaat over informatieverwerking van fysieke stimuli door ons brein

Scale (sec)	Time Units	System	World (theory)
10^7	Months		SOCIAL BAND
10^6	Weeks		
10^5	Days		
10^4	Hours	Task	RATIONAL BAND
10^3	10 min	Task	
10^2	Minutes	Task	
10^1	10 sec	Unit task	COGNITIVE BAND
10^0	1 sec	Operations	
10^{-1}	100 ms	Deliberate act	
10^{-2}	10 ms	Neural circuit	BIOLOGICAL BAND
10^{-3}	1 ms	Neuron	
10^{-4}	100 µs	Organelle	

Informatieverwerking Fysieke Stimuli In Ons Brein

Sensation: [Sensibilisatie]

'...immediate and basic experiences generated as stimuli fall on our sensory systems'
→ Verwerken van ruwe data (prikkels of Fysieke stimuli) volgens een vast patroon

Perception: [Perceptie]

'...interpretation of those sensations, giving them meaning and organization'
→ Gestuurd door "ingegebouwde" informatie (niet lerend),

Cognition: [Cognitie]

'...acquisition, storage, retrieval, and use of information'
→ Gestuurd door "verworven" informatie (zelf-lerend)

M.W. Matlin & H.J. Foley, 1992

Sensatie

[gewaarwording]

Proces waar gestimuleerde receptoren een patroon van neurale impulsen creëert

{=> registratie van externe /interne prikkels}

Perceptie

[Waarnemen]

Proces dat de inkomende sensorische patronen bewerkt en er betekenis aan geeft

{=>interpretatie van de geregistreerde prikkels}.

Wordt sterk beïnvloed door herinneringen, motivatie, emotie en andere psychologische processen.

De mens als maatstaf der dingen

Intelligence	Description	Example
Linguistic intelligence	The ability to speak, recognize, and use mechanisms of phonology (speech sounds), syntax (grammar), and semantics (meaning).	Narrators, Orators
Musical intelligence	The ability to create, communicate with, and understand meanings made of sound, understanding of pitch, rhythm.	Musicians, Singers, Composers
Logical-mathematical intelligence	The ability of use and understand relationships in the absence of action or objects. Understanding complex and abstract ideas.	Mathematicians, Scientists
Spatial intelligence	The ability to perceive visual or spatial information, change it, and re-create visual images without reference to the objects, construct 3D images, and to move and rotate them.	Map readers, Astronauts, Physicists
Bodily-Kinesthetic intelligence	The ability to use complete or part of the body to solve problems or fashion products, control over fine and coarse motor skills, and manipulate the objects.	Players, Dancers
Intra-personal intelligence	The ability to distinguish among one's own feelings, intentions, and motivations.	Gautam Buddhha

Cognitie refereert aan ons intellectuele & onderscheidende vermogen van informatie

Onder zuivere intellectuele functies worden verstaan:
oordeelsvermogen, zelfbeleving,
lichaamsbeleving,
logisch redeneren & creatief denken.

Mensen vormen een gefantaseerd “Cognitief” mentaal model van de wereld om hun heen.

PERCEPTIE versus COGNITIE

We vinden het normaal dat we dingen kunnen zien, horen, ruiken, proeven en voelen.

We kunnen ons een beeld vormen van datgene wat we:

- horen binnen gehoorsafstand;
- zien binnen het gezichtsveld;
- voelen binnen handbereik;
- ruiken binnen reukafstand.

Maar de mens ziet, ruikt en hoort niet alles. De mens laat ook vaak alleen de signalen toe die hij geselecteerd heeft en die voor hem een bepaalde betekenis hebben.

We kunnen dat onbewust doen.
Dit gebeurt vooral bij niet veranderende signalen (gewoontegetrouw).
We kunnen dat heel bewust doen door:

- naar iets of iemand te kijken, te luisteren;
- iets of iemand te betasten;
- te proeven;
- te lezen;
- te ruiken.

UITVAL VAN COGNITIE

COGNITIEVE Functies	UITVAL Verschijnselen
bewustzijn	<ul style="list-style-type: none">- schommelingen in het bewustzijn zoals wisselingen in helderheid, verlies van aandacht, verminderd concentratievermogen, verhoogde of verlaagde waakzaamheid
geheugen	<ul style="list-style-type: none">- niet onthouden van nieuwe informatie, verlies van recent geheugen, desoriëntatie in tijd plaats en persoon
denken	<ul style="list-style-type: none">- versneld of vertraagd, onsaamenhangend, wanen, achterdocht, verminderd vermogen tot oordelen en kritisch denken
stemming	<ul style="list-style-type: none">- angst, radeloosheid, opstandigheid, lusteloosheid, een sombere vijandige of geprikkelde gemoedstoestand, niet kunnen beheersen van gevoelens
waarnemen	<ul style="list-style-type: none">- dispercepties, gezichts-, gehoor- en gevoelshallucinaties
psychomotoriek	<ul style="list-style-type: none">- onrust, agitatie, agressie, ontbreken van activiteiten, apathie, verstarring
autonome lichaamsfuncties	<ul style="list-style-type: none">- versneld hartritme, verhoogde bloeddruk, verhoogde transpiratie, incontinentie

COGNITIE & SEMIOTHIEK

“De menselijke maat” wordt voor een groot deel bepaald door denken en waarnemen, dus gedragingen die ofwel tot kennisverwerving leiden of voor het gebruik van kennis nodig zijn.

Information

Data with structure = processed data

Value-added to Data

- Summarised
- Organised
- Analysed

Structured versus Unstructured

Data Structuring

Structured (organized) data:

This is data that can be thought of as observations and characteristics. It is usually organized using a table method (rows and columns).

Unstructured (unorganized) data:

This data exists as a free entity and does not follow any standard organization hierarchy.

Structured Data

High Degree of organization, such as a relational database

Column	Value
Patient	Joe Brown
Date of Birth	02/13/1972
Date Admitted	02/05/2014

Unstructured Data

Information that is difficult to organize using traditional mechanisms

"The patient came in complaining of chest pain, shortness of breath, and lingering headaches...smokes 2 packs a day... family history of heart disease...has been experiencing similar symptoms for the past 12 hours...."

Generalized form of data structure

Data Table [DATA MATRIX]

A generalized version of the data table is shown.

This table can represent any number of observations described over multiple variables.

This table describes a series of observations (from o_1 to o_n) where each observation is described using a series of variables (from x_1 to x_p). A value is provided for each variable of each observation.

	Variables					
Observations	x_1	x_2	x_3	...	x_p	
o_1	x_{11}	x_{12}	x_{13}	...	x_{1p}	
o_2	x_{21}	x_{22}	x_{23}	...	x_{2p}	
o_3	x_{31}	x_{32}	x_{33}	...	x_{3p}	
...
o_n	x_{n1}	x_{n2}	x_{n3}	...	x_{np}	

Most data that exists in text form, including server logs and Facebook posts, is **unstructured**

Scientific observations, as recorded by careful scientists, are kept in a very neat and **organized (structured)** format: **THE DATA TABLE**

A genetic sequence of chemical nucleotides [ACGTATTGCA] is **unstructured** even if the order of the nucleotides matters

Generalized form of data structure

Data Table [DATA MATRIX]

A generalized version of the data table is shown.

This table can represent any number of **observations** described over multiple **variables**.

This table describes a series of observations (from o₁ to o_n) where each observation is described using a series of variables (from x₁ to x_p). A value is provided for each variable of each observation.

Observations	Variables					
	x ₁	x ₂	x ₃	...	x _p	x _{1p}
o ₁	x ₁₁	x ₁₂	x ₁₃	...	x _{1p}	
o ₂	x ₂₁	x ₂₂	x ₂₃	...	x _{2p}	
o ₃	x ₃₁	x ₃₂	x ₃₃	...	x _{3p}	
...
o _n	x _{n1}	x _{n2}	x _{n3}	...	x _{np}	

Patient ID	Treated	Age	Outcome	Random
1	Yes	Young	Positive	0.24
2	No	Young	Positive	0.85
3	Yes	Old	Negative	0.64
4	No	Old	Negative	0.70
5	No	Old	Negative	0.87
6	No	Old	Negative	0.72
7	No	Old	Negative	0.86
8	No	Young	Negative	0.16
9	No	Young	Positive	0.17

Principles of Data Science

Packt

Data [gegevens]

Raw Facts

No Context

Numbers

Symbols

Data comes from the Latin word, "datum," meaning a "thing given."

Although the term "data" has been used since as early as the 1500s, modern usage started in the 1940s and 1950s as practical electronic computers began to input, process, and output data.

Data Quantification

Quantitative [Numerical] data:

This data can be described using **numbers**, and basic mathematical procedures, including addition, are possible on the set. It can be **discrete** (countable numbers) or **continuous** (infinitely large or small)

Qualitative [Categorical] data:

This data are categories. It cannot be described using numbers and basic mathematics. Is generally thought of as being described using "**natural**" categories and **language**.

- Quantitative values
 - **Measure** things
 - *Revenue, Units, Marketshare, Duration, Customer Satisfaction, Visits, Price, etc.*
- Categorical values
 - Subdivide things into **groups**
 - *Region, product, category, employee, etc.*

DATA: PRIMARY LEVELS OF MEASUREMENT

We onderscheiden 4 meetniveaus:

nominaal + ordinaal [discrete data]

interval + ratio [continue data]

CATEGORICAL DATA

NOMINAL DATA

ORDINAL DATA

DATA: LEVELS OF MEASUREMENTS versus OBSERVATION SCALES

Meetniveaus [level] /Meetschalen [scale]:

De hoogte van het meetniveau is bepalend voor:

Statische-analyse / Grafische weergave

<u>Meetniveaus & hun kenmerken</u>		Scale	Rationiveau
	Ordinaal niveau	Intervalniveau	Verhouding blijven gelijk
Nominale niveau	Ordening	Gelijke verschillen	Gelijke verschillen
Onderscheid	Onderscheid	Onderscheid	Onderscheid
Geslacht	Opleidingsniveau	Intelligentie	Leeftijd

Data Typen versus Meetschalen

A modern more holistic view of data {types}

In "What are algorithms dreaming of ?"

Cardon proposes a framework based on four types of web measurements, each resting on a specified data type:

1st type of filter bubble: the one created by audience measurement

2nd type of filter bubble: the one created by hyperlinks

3rd type of filter bubble: the one created by social influencers

4th type of filter bubble: one created by our own behavior

A modern more holistic view of data {types}

	On the side	Above	In	Below
Examples	Médiamétrie, Google Analytics, advertising	Google Page Rank, Digg, Wikipedia	Number of Facebook friends, Retweets on Twitter, ratings	Amazon Recommendation, Targeted advertising
Data	Views	Links	Likes	Tracks
Population	Representative sample	Selective vote, communities	Social network, affinities, declarative data	implicit feedback and behaviors
Type of computation	Vote	Meritocratic rankings	Benchmark	Machine Learning
Principle	Popularity	Authority	Reputation	Prediction
